## Portland

- Measured sea level
- Range of modeled future sea level for Maine's adopted scenario\*

\*US Interagency Task Force  
Intermediate Scenario  
(Sweet et al., 2022)

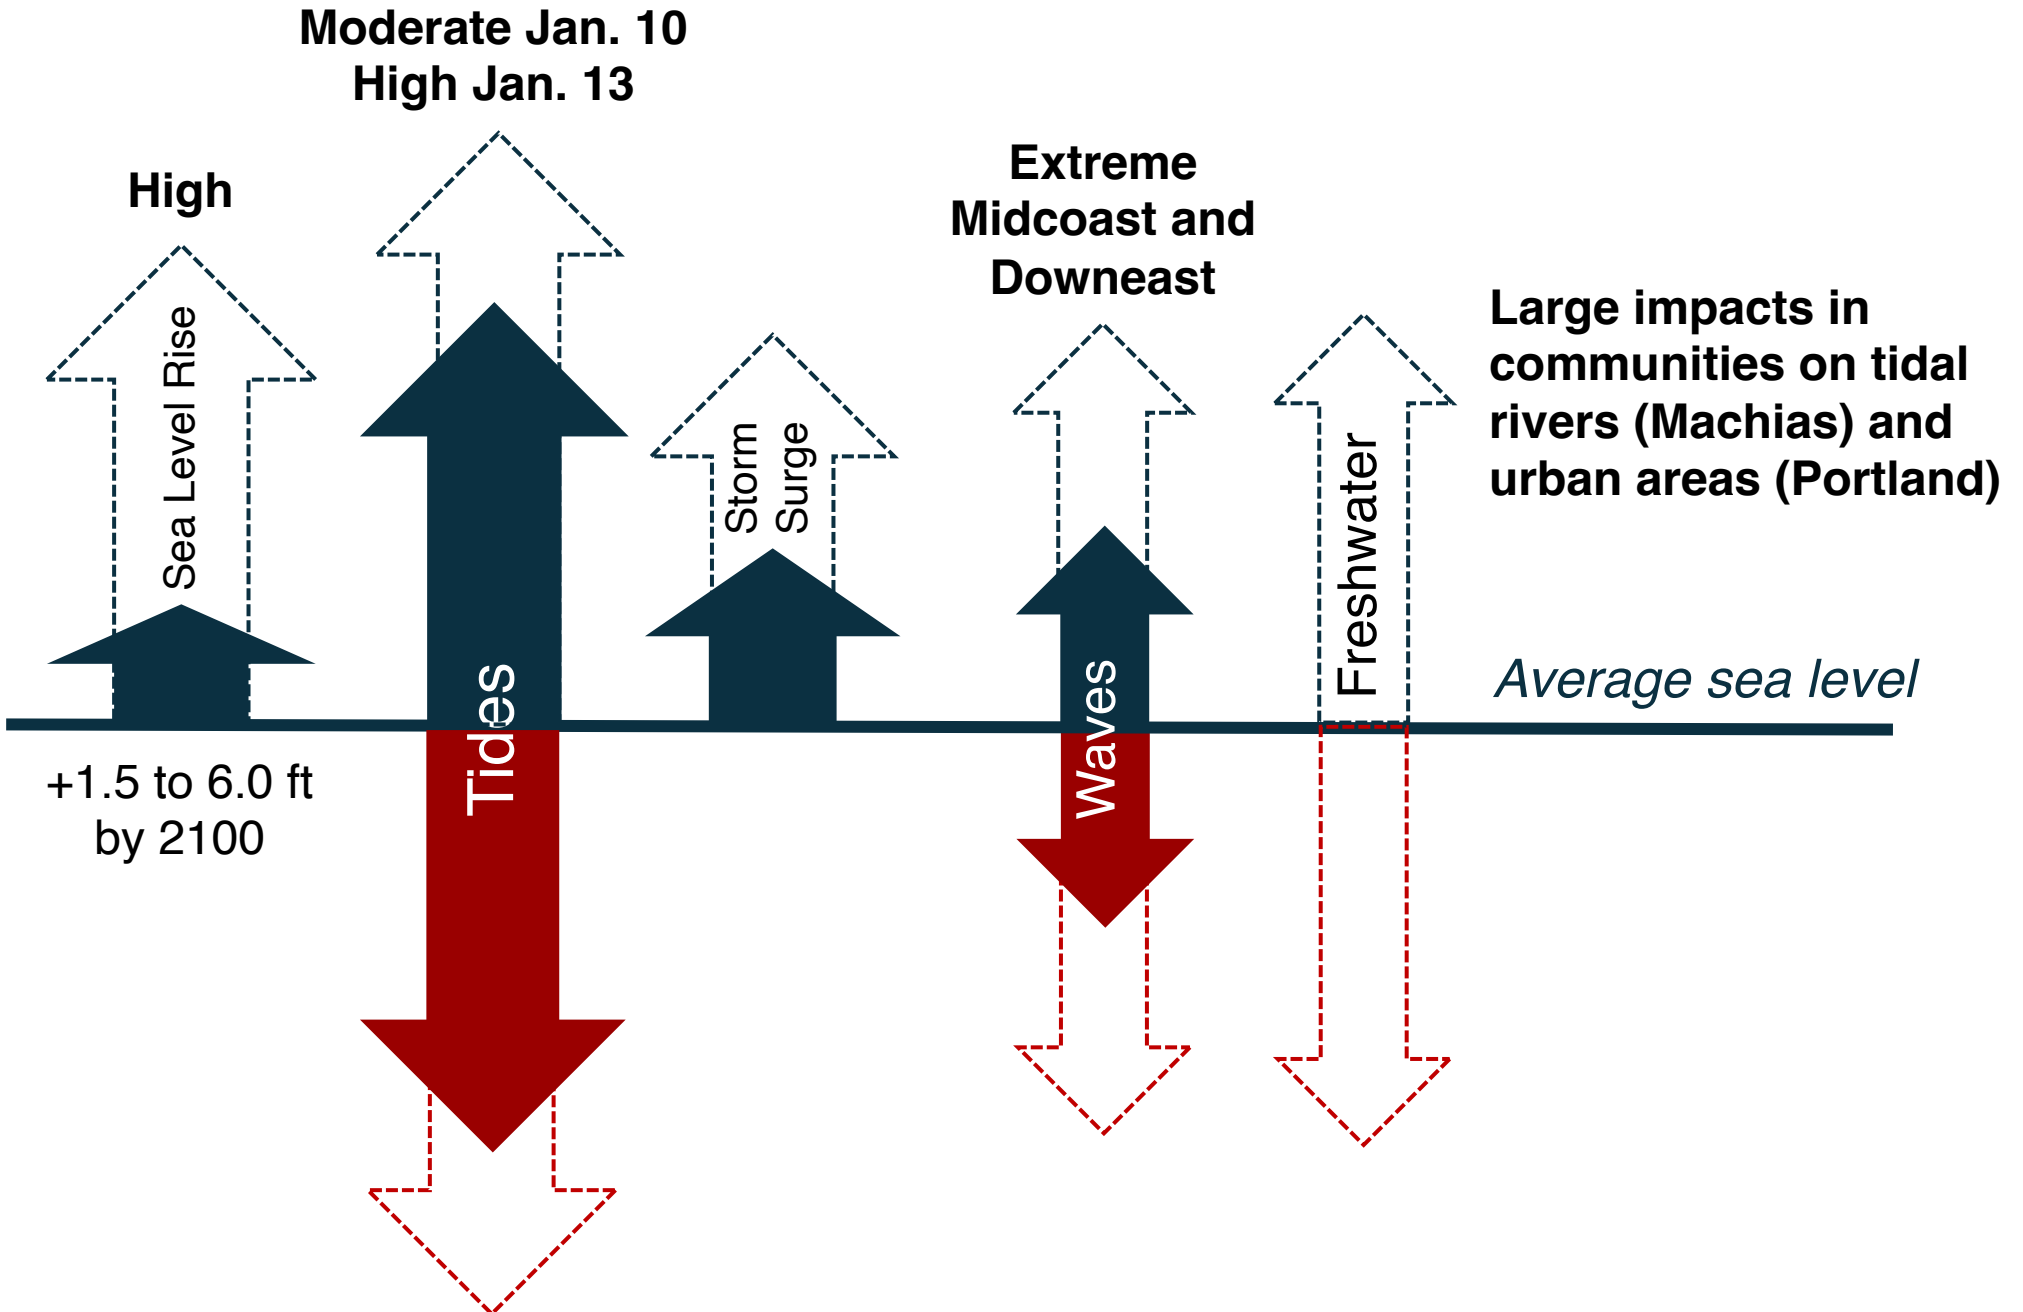

## Annual measured sea level (Portland)

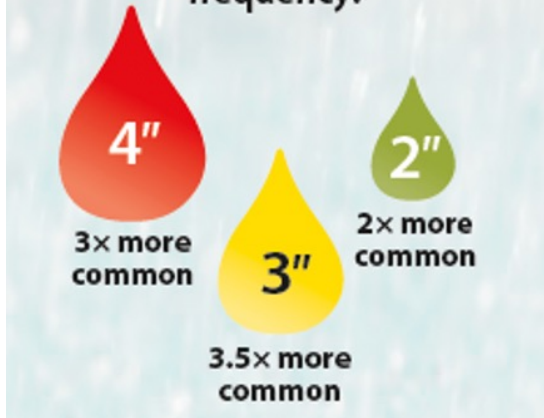

*If this annual sea level curve were flat over the past 100 years...*

Stillwater level (not including waves) on Wednesday, January 10 was severe (5-to-25-year return period) but not as extreme as the “100-year” event we often plan for.

Saturday, January 13 was extreme in southern Maine, similar to the Blizzard of ‘78.

We are experiencing heavier rains. While still relatively uncommon, events of 2, 3, or 4 inches have increased in frequency.

Maine's Climate Future 2020 Update

- Maine's climate is getting wetter; **heavy precipitation events are becoming more common** in Maine and the Northeast region in association with warming-driven intensification of the hydrologic cycle (MCF, 2020; STS 2020; NCA5)
- Oct–Nov storms in New England found a significant trend toward **more precipitation accompanying wind storms with gusts > 58 mph**; no significant trend in storm frequency or wind intensity for the period 1979–2019 (Simonson et al., 2020)

## Storm Trends

- More investigation is needed to understand both historical and projected storm trends in Maine, particularly around the increasing frequency and/or intensity of SE storm events
- Analysis of historical storms in Maine is underway- see Maine Climate Council's STS update

d) Days with 5+ inches of precipitation

Coastal Risk Explorer

Rising sea levels will impact Maine's coast in many different ways. One important effect will be the inundation of roads, which will prevent access to homes and businesses as roads are flooded. Use this tool to explore how rising sea levels will affect roads in coastal cities and towns, see where road networks will be inaccessible to emergency responders, and how that relates to the overall social vulnerability of the community. Social vulnerability is provided for each coastal block group, based upon 17 socioeconomic and demographic factors.

# Maine Climate Council Equity Subcommittee Priority Populations

**Individuals and Households:** Low-income individuals and households, older adults (age 65+), people with asthma or other health vulnerabilities, people with disabilities, people with limited access to transportation, Black, Indigenous and People of Color (BIPOC), people with limited English proficiency, low-income residents of rental housing (especially multifamily), mobile home residents, low-income homeowners, unhoused individuals, and families.

**Individual Workers:** Unemployed/underemployed, limited work authorization, students, people with limited English proficiency including New Mainers, gender, people transitioning from prison or in recovery, and/or migrant workers

**Geographic Areas and Communities:** Low-income communities, **rural communities, small towns with limited staff capacity**, disadvantaged communities (discussed below), **climate-frontline communities**, and/or Tribal and Indigenous communities.

**Businesses:** **Businesses in the natural resource industries like agriculture, forestry, and fishing**, clean energy industry (including energy efficiency), small businesses, minority- or women-owned business enterprises (MWBEs).
